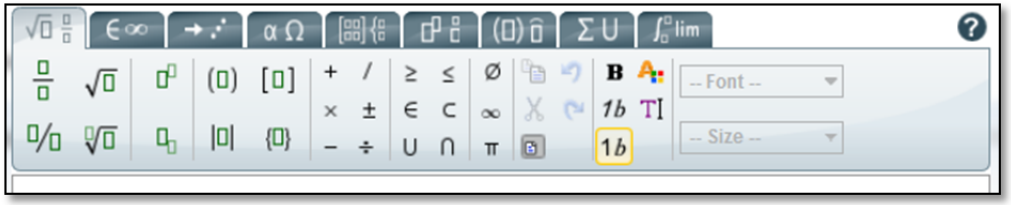
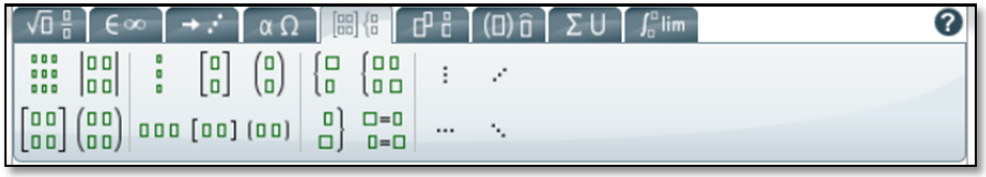
Content Editor Math Formulas

Explain how it works

WIRIS provides the Math formula editing capabilities of the Content Editor introduced in recent version of clickUP. The WIRIS plugin came in the form of a Java Applet. This meant that math editing was not available to all platforms as Java virtual machine capabilities were required on the target platform. This version brings a new WIRIS editor that is based on JavaScript. This extends the functionality of the WIRIS math editor to all platforms capable of running a JavaScript enabled browser. The move from the non-accessible applet-based editor to a JavaScript-based editor improves accessibility.

The following formulas are supported and can be added anywhere where you have the Content Editor using this icon:

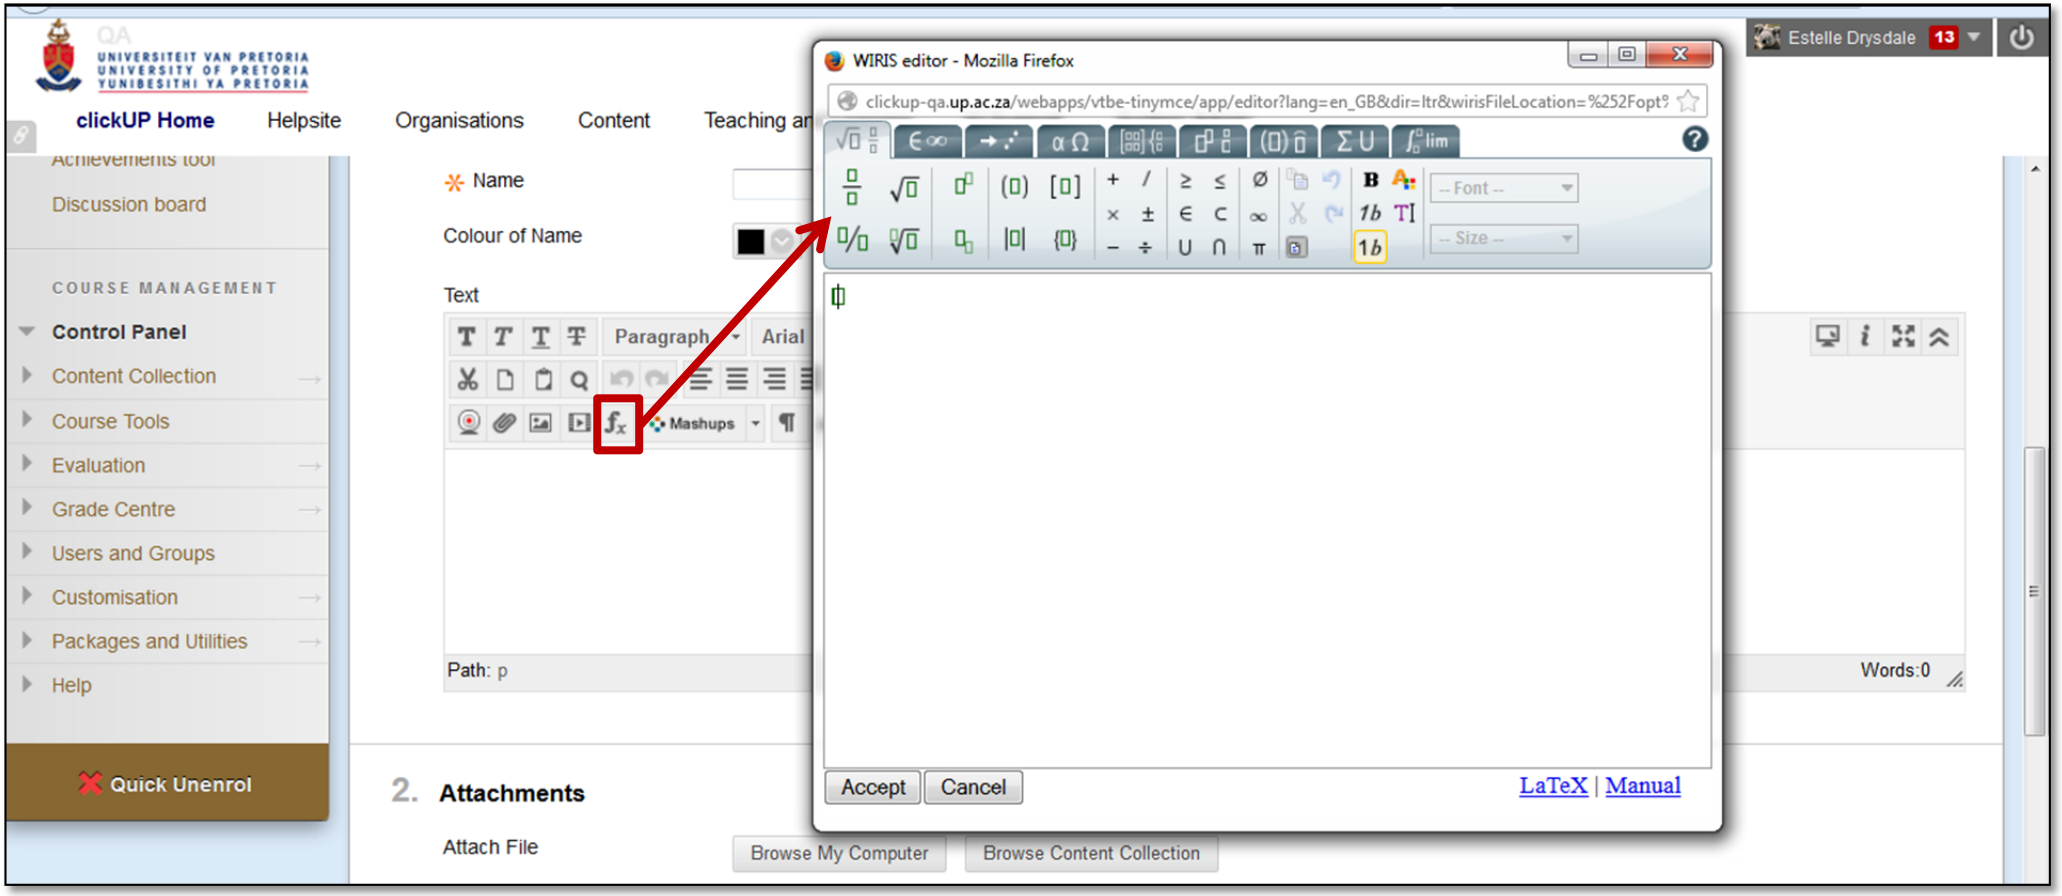


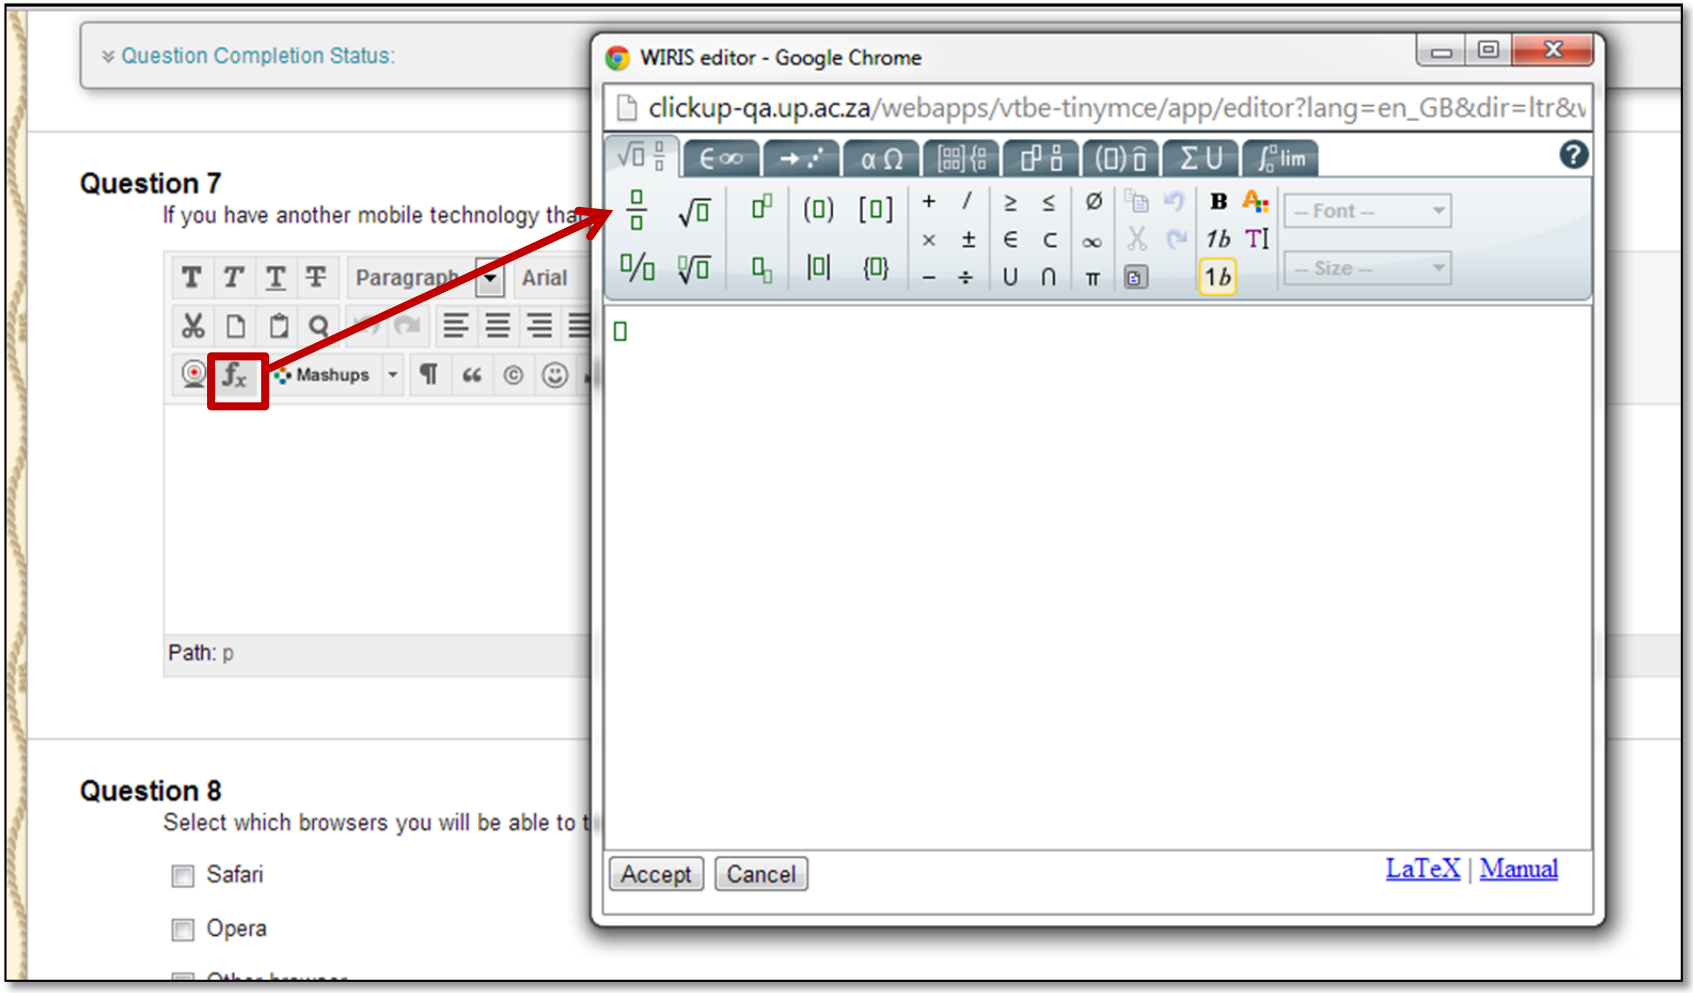


sin cos tan
log ln

From Instructor side

Might take some time to get used to the toolbars ….



From student side


Give practice exercises for the students before you let them do a test against time where they have to use the math editor.
